RATIONALE

Sleep disorders are common in children with asthma and are increasingly implicated in poor asthma control. Smart wearables such as the Fitbit wristband allow monitoring of users’ sleep duration and quality in their natural surroundings. However, the utility and efficacy of using such wearable devices to monitor sleep in pediatric patients with asthma have not been well-established.

Thus, the objective of this study is to demonstrate the feasibility of recording sleep quality and sleep duration using Fitbit in children with asthma.

METHODS

34 children, ages 5 to 17 years, with varying levels of asthma severity (mild, moderate, and severe) were recruited from Dayton Children’s Hospital for a period of one month or three months (Table 1). Each patient was provided with a kHealth kit (Figure 1) comprising of an Android tablet with a mobile health application that asks contextually relevant questions, a Bluetooth connected Fitbit Charge 2, Foobot (an indoor air quality monitor), and a peak flow meter. 29 different parameters were measured and 1862 data points were collected per patient per day. For this study, Fitbit software-calculated time in bed, sleep time, time in REM sleep, light sleep, and deep sleep data were downloaded from all subjects with an aggregated total of 700 data points. Sleep efficiency was calculated as total sleep time over time in bed. The proportion of time in sleep stage was calculated as time in sleep stage over total sleep time.

RESULTS

Table 2: Sleep Characteristics by Age Group

<table>
<thead>
<tr>
<th>Sleep</th>
<th>Average Time (Minutes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Age 5 to 12</td>
<td>Age 13 to 17</td>
</tr>
<tr>
<td>(Pre-teens, n=19)</td>
<td>(Teens, n=15)</td>
</tr>
<tr>
<td>All Patients</td>
<td></td>
</tr>
<tr>
<td>(n=34)</td>
<td></td>
</tr>
<tr>
<td>Time in Bed</td>
<td>465.30</td>
</tr>
<tr>
<td>Sleep Time</td>
<td>417.25</td>
</tr>
<tr>
<td>REM Sleep</td>
<td>95.89</td>
</tr>
<tr>
<td>Light Sleep</td>
<td>247.90</td>
</tr>
<tr>
<td>Deep Sleep</td>
<td>89.00</td>
</tr>
<tr>
<td>Sleep Efficiency</td>
<td>90%</td>
</tr>
</tbody>
</table>

These results correlated well with polysomnography based normative data in children.

Figure: Teenagers spent a significantly higher time asleep on weekends as compared to week nights.

The Proportion of Sleep Time Spent

Deep Sleep: 19.8%
REM Sleep: 21.7%
Light Sleep: 58.5%

CONCLUSION

Our findings supported the potential use of wrist-worn devices to continuously monitor sleep duration and quality in children with asthma. This should allow for better evaluation of the effect of sleep on asthma outcomes in children.
