

Dr. Amit Sharma is a research associate in the Chemical Sciences and Engineering Division at the Argonne National Laboratory. His current research is in the area of applied theoretical/computational quantum mechanics with focus on developing new theory, investigation of thermochemistry, study of dynamics and kinetics of chemical reactions that are important to understanding combustion. Dr. Sharma received his PhD in the area of atomistic modeling of materials from the Max-Planck Institute for Plasma Physics/University of Greifswald, Germany. He conducted his postdoctoral research in the Department of Chemistry and Emerson Center for Scientific Computation at Emory University in the area of theoretical and computational studies of hydrocarbons with focus on developing full dimensional potential energy surfaces and dipole moment surfaces. He developed high performance molecular dynamics trajectory codes and modeled the super energy transfer collision of translationally hot H atom with acetylene. His research interests include developing full dimensional potential energy surfaces for studying energy-transfer collisional dynamics of molecular bath gases, multiscale modeling of materials, modeling molecule-surface reactions in the condensed phase and high performance scientific computing.
